CESARE FERRARI LAB

Cesare Ferrari Lab is an innovative research laboratory in the field of furnishings, items for interiors and designer objects.

Recently, one of the most interesting innovations is the so called "liquid metal" finish, that is, the possibility to give any solid surface a real metal coating.

A thin, rigid covering can be applied to surfaces with any configuration, maintaining all the properties of non ferrous metals. The covering is a powder composed of nano particles of brass, copper, nickel, bronze, gold and their mixtures. Surfaces which have been finished with liquid metal, once smoothed, can be satinized, pickled, and polished like all metal surfaces.

Liquid metal can be applied in several fields, thankstothewinningcombination of high technology with our skillfulness in manual work/craftsmanship. From the finishes of objects, furniture, writing, logos including those for exteriors, to sculptures and for working indoor and outdoor elements such as grills, balusters, capitals, helicoidal structures etc.

TYPES OF APPLICATION

WHY LIQUID METAL?

The application of liquid metal has multiple benefits:

- Economic savings and time savings, because the process does not require moulds to be made for casting the metals or the use of foundries;
- Possibility to realize various shapes: curved, concave, engraved, intaglied and special shapes.
- Possibility to obtain the shades required by mixing various coloured metals together, for example, brass and copper, bronze and gold.

In some cases the use of metal sheets together with the liquid metal is recommended, depending on the project to be carried out. Our technicians are at your disposal to carry out a technical and commercial evaluation of your projects.
